

PADD 3 Sour & Heavy Crude

Supply / Demand Balance Model — US Gulf Coast, month by month

SUPPLY

GoM • imports • exports

PIPELINES

Cushing corridor

REFINERIES

coker-anchored demand

BALANCE

monthly long / short

Sour vs Heavy Crude Demand · Monthly (kbd)

Heavy Crude Supply by Source · (kbd)

Supply — multi-source

- Gulf of Mexico production split by grade (Mars, Poseidon, SGC, Thunder Horse...)
- Waterborne imports by grade & country; exports netted out
- Inter-PADD pipeline inflows reconciled to reported movements

Pipelines — Canadian heavy

- Cushing corridor modeled end-to-end: Enbridge Mainline → Flanagan South, Spearhead, Keystone → Steele City
- Seaway, Marketlink & rail as the Gulf Coast delivery legs
- Shows most Gulf heavy arrives by pipe, not tanker

Demand — coker-anchored

- Bottom-up for the key Gulf Coast refineries (EIA capacity data)
- Heavy appetite sized by delayed-coking capacity — the coker, not CDU size, drives heavy demand
- Configurable low / mid / high run range for scenarios

Analytics & delivery

- 10+ years of EIA monthly history parsed into a seasonal “normal” by calendar month
- Delivered in 100% native Excel — live formulas, no macros
- Every assumption a transparent, editable input
